The Newborn Behavioral Observations system (NBO) - Giving babies a Voice - is an infant-focused, family-centered relationship-based evidence-based tool, designed to sensitize parents to their baby’s competencies and individuality, in order to foster positive parent-infant interactions. Recent studies show that the NBO is associated with more optimal parent-infant interaction, provider confidence, increased father involvement and reduction in post-partum depression symptoms.

Learning objectives: The two-day program is followed by telementoring, providing trainees with information on newborn behavior and development and infant mental health, teaches trainees how to administer the NBO and reviews essential clinical skills in the implementation of the NBO system.
