

The NeuroMISC Study

Neurologic Sequelae of Multisystem Inflammatory Syndrome in Children (MIS-C)
In collaboration with Overcoming COVID-19

If you or your child had MIS-C, you may be able to join the new NeuroMISC research study!

What is the purpose of this research study?

This study aims to understand whether there are differences in long-term brain functioning in children who recover from MIS-C.

This a multi-site study that is being conducted all over the country!

What is MIS-C?

- MIS-C is a syndrome that may affect children exposed to COVID-19.
- Some children experience neurological symptoms, such as confusion, while they are hospitalized.
- It is not known if there are long-term effects on brain function.

What will I have to do if I participate?

- Complete a remote evaluation from your home, including a neurological exam and cognitive testing.
- Complete questionnaires about your mental health, and an interview about your/your child's functioning in daily life.
- If you live near Boston, you may be invited to come to the hospital for a brain MRI.

Will I be compensated for my participation?

- You will receive a free iPad to complete the remote evaluation. You will get to keep this for your own use after testing is complete!
- If you are invited and choose to participate in a brain MRI, you will be given additional compensation.

You will receive the results of all testing, which may help you better care for your child!
